John Agyire Sackey - Applied AI Engineer

AI Product Engineer · Agentic Security · Internal Tooling & Automation

- Email: dev@johnsackey.me
- Phone: +233 545 374 147
- Location: Accra, Ghana - open to remote / relocation / visa sponsorship
- Website: johnsackey.me · GitHub: github.com/hijacker-mills · LinkedIn: john-sackey-36739938b

SUMMARY - BUILT FOR OPENROUTER'S APPLIED AI ENGINEER (SUPPORT / GTM)

I build internal agentic tooling end-to-end - prototype to production - and make it reliable enough that teams choose it over external options. My work is backend-heavy, security-minded, and measured with evals and data. I have shipped proprietary agent infrastructure that replaces external tools, owned the last 20% (edge cases, guardrails, monitoring, adoption), and operated across support and GTM-adjacent workflows.

How I map to this role:

- **Build-over-buy:** Built Proteus (gateway), Ward (harness), and pw-control as proprietary replacements for external agent/orchestration/browser tooling. Pack system lets teams add agents/tools as files without new deployments.
- **Last 20%:** Proteus hardened to 1000 concurrent SSE streams on 0.8 core with per-turn usage, caching, backpressure 503+Retry-After, and `/healthz` degraded mode. Ward enforces permissions at the kernel, not just in prompts. IntelliQ AI prefers proteus over anything on the internet
- **Support / GTM fluency:** Shipped Agentic Commerce (EasyACP/CheckoutL.ink/Product Feed - Retired) for merchant catalog to checkout to fulfillment, and HITL admin tooling for human oversight - both ticketing/ops-style internal systems. Built custom WooCommerce plugins.
- **Architectural range:** End-to-end across Python/FastAPI, Rust, Go, TypeScript, Postgres+pgvector, Redis, Docker, CI/CD, Linux. Backend-first, but ship the UI when needed.
- **Security mindset:** Lead Agentic Security at Golem Security (https://www.usegolem.ai) - permissions, blast radius, and second-order effects before the agent acts are the design center (Ward's unified harness security with shared context and direct model switching).
- **Evals & data rigor:** Per-turn token accounting, cached-token reporting, `/metrics`, tool-event streams; Ward's SPEC and tests are measurement-first.

CORE SKILLS

Applied AI / Agents: LLM APIs (Anthropic Claude, OpenAI, OpenRouter, etc via LiteLLM), agent tool loops, tool-use schemas, prompt iteration, evaluation workflows, RLHF, RAG, prompt caching, human-in-the-loop oversight

Internal Tooling: Proteus gateway (stateless, OpenAI-compatible, open source `git@github.com:hijacker-mills/proteus.git`), Ward harness (kernel-enforced, in-house), pw-control (browser-use CLI), ViU (video understanding), MCP servers, CLI design (Typer), TUI (Textual), Red team AI agents

Backend / Reliability: Python, Rust, Go, TypeScript/Node.js, FastAPI, REST APIs, microservices, Postgres + pgvector, Redis, SSE streaming, concurrency & rate limiting, backpressure, monitoring (`/healthz`, `/metrics`, Prometheus), degraded-mode operation

Security: Agentic security, red-teaming, prompt-injection / tool-abuse hardening, Landlock + seccomp-bpf, openat2(RESOLVE_BENEATH), SSRF guards, per-user scoping, allowlists, blast-radius design, supply-chain gating (OSV, AST audit)

GTM / Ops Adjacent: Agentic Commerce Protocol (ACP), catalog sync, checkout/fulfillment flows, custom WooCommerce plugins, CRM/ticketing-style admin tooling

WORK EXPERIENCE

Lead, Agentic Security - Golem Security (https://www.usegolem.ai) · 300mil.com - ***Feb 2026 - Aug 2026 (Present)***

Internal agentic infrastructure with security as the product.

- Own security model for agent systems and computer-use infrastructure at https://www.usegolem.ai. Every integration is scoped with least-privilege grants that derive kernel boundaries.
- Build offensive and defensive agent workflows; ship evaluation harnesses and guardrails that gate production releases.
- Built Ward in-house to control all harnesses together, unify security, share context between harnesses, and allow changing models directly on the same context.
- Directly relevant to OpenRouter: broad internal access is the risk surface - I treat permissions and blast radius as first principles.

Lead Software / AI Engineer - WithGiga · 300mil.com - ***Aug 2025 - Jan 2026 - Retired (computer-use only)***

- Led computer-use AI infrastructure (computer-use only) - live at https://www.picua.ai. Built backend services, automation pipelines, and developer tooling for AI-assisted machine interaction.
- Principle: internal tool that *replaces* buying a fleet of external remote-access/orchestration tools.

Software / AI Engineer - Human in the Loop (HITL) · 300mil.com - ***Dec 2025 - Feb 2026***

- Built human-feedback-driven AI systems and analytical admin tooling for AI workflow oversight - internal support-ops tooling.
- Owned eval frameworks and quality testing. Work won **2026 Webby Award - People's Voice Winner, Best Responsible AI Implementation** (hitl.sh/blog/2).

Lead Software / AI Engineer - EasyACP · 300mil.com - ***Nov 2025 - Jan 2026 - Retired***

- Led Agentic Commerce on the **Agentic Commerce Protocol** - built custom WooCommerce plugins (checkout bridging, HPOS, webhooks, product matching) and backend architecture for merchant catalog sync, product feeds (JSON/XML/CSV/TSV), and CheckoutL.ink (Stripe, dynamic pricing).
- Steady replacement of external commerce tooling with owned protocol and implementation. Retired Jan 2026.
- Drove reliability: secure webhooks, duplicate prevention, validation.

Software Engineer - JTech Innovations Gh - Freelance - ***May 2023 - Jun 2025***

- Full-stack for international clients (Python, Go, Node.js). Improved performance, deployment workflows, and code quality.

SELECTED PROJECTS - PROOF OF BUILD-OVER-BUY + LAST 20%

Proteus - Many agents. One gateway. - Open Source - `git@github.com:hijacker-mills/proteus.git` **- github.com/hijacker-mills/proteus · Apache-2.0**

Proprietary agent gateway that replaces per-agent deployments and external orchestration.

- **Build over buy:** One stateless process serves any number of agents. Agent = `(persona, toolset)` file in `agents/` ; adding an agent is adding a file, no restart, no new box. Packs (`PACKS=/srv/your-integration`) mount whole integrations without touching gateway code.
- **End-to-end ownership:** FastAPI + LiteLLM (model-agnostic: Anthropic/OpenAI/OpenRouter/Groq/Gemini/Ollama/Codex-OAuth), Postgres+pgvector (tiered memory), Redis (dedup/stream), SSE with `proteus_tool_event` inline streaming, CLI (`doctor/tui/chat/agent/tool/auth/health/bench`).
- **Reliability / last 20%:** `MAX_CONCURRENT_COMPLETIONS` + `RATE_LIMIT_PER_MINUTE` per-worker, backpressure (20 served / 100 clean 503 under 120-request spike), `PROMPT_CACHING` with stable-first layout, `STREAM_COALESCE_MS` , tool parallelism (`MAX_PARALLEL_TOOLS=8` - 5x0.4s tools in 0.46s), `/healthz` = ok/degraded/down, PgBouncer-safe pooling, idle-cost aware cron.
- **Measured impact:** 1000 concurrent SSE streams on 0.8 core, p50 TTFB 0.9s under full load, ~44KB/stream, 10,500 requests at 2000 concurrent with zero failures, prompt-cache win 0 to 3,781 cached tokens on Sonnet.
- **Guardrails:** `user_id` injected server-side, host tools gated by `ADMIN_API_KEY` , SSRF guard on fetch/browser, per-tenant token usage to `/metrics` .

Ward - Kernel-enforced coding-agent harness · Rust · MIT · Linux only

Built in-house to control all harnesses together, unify security, share context between harnesses, and change models directly on the same context.

- **Build over buy:** None of 7 surveyed harnesses had both expressive policy and real enforcement. Built Ward: `Read/Write/Exec/Net/Tool/Env` grants derive Landlock + seccomp-bpf rulesets. No config key sets a sandbox root - grant `Write(./src)` and boundary follows.
- **Security mindset:** 4 gates - 1 Hardline to 2 Grant check to 3 Adjudication (plan/ask/accept-edits/skip-permissions) to 4 Kernel (derived). Broker is entire TCB, serves fds via SCM_RIGHTS, `openat2(RESOLVE_BENEATH|RESOLVE_NO_SYMLINKS)` atomically confines.
- **Harness depth:** Hands-on across Claude Code, Codex, Kimi, Copilot as confined subprocesses; own harness plus pw-control and Proteus = 3+ harnesses tried/built. `ward doctor` , `ward check 'rm -rf /'` , `ward run --read/--write/--net -- ...` .

PiCUA AI - Physical Computer-Use Agent - Main Project - https://www.picua.ai

World's first physical computer-use AI agent - PiKVM-compatible.

- Full HID control, power management, mass storage / ISO workflows, screenshot capture, hosted assistant + web UI + HTTP API. Retired Jan 2026, separate from Golem Security.

ViU - Video Understanding - Built by me - `git@github.com:hijacker-mills/ViU.git` **- github.com/hijacker-mills/ViU**

Turns a video into evidence an agent can understand - model-agnostic at reasoning layer.

- Pipeline: `MP4 to ffprobe to TransNetV2 shot detection + CLIP embedding + farthest-point diverse sampling + near-duplicate dedup to Deepgram/Whisper transcript aligned to frames to bundle (frames.json + kf_*.jpg)` . Agent views frames + transcript to understand.
- Exposes `VIDEO_TOOL` via `viu/agent_tool.py` as model-agnostic `prepare_video` tool.

pw-control - Browser-use CLI - hijacker-mills/pw-control

Proprietary browser harness that replaces external browser-automation buys - also the `browser` *tool inside Proteus and probe backend for Ward.*

EasyACP Ecosystem - Retired - Custom WooCommerce plugins built by me

- CheckoutL.ink (ACP + Stripe), EasyACP Link (custom WooCommerce plugin: secure webhook, HPOS, product matching), Product Feed (ACP Spec).

Contribution

OpenClaw Code - `git@github.com:damoahdominic/occ.git` **- github.com/damoahdominic/occ - openclawcode.ai**

My contribution is only this - Desktop IDE for OpenClaw. Visual setup, dashboard monitoring, one-click fixes; Windows / macOS / Linux.

TOOLING & HARNESSES I USE

- **Ward** - daily driver with unified harness control and shared context
- **Proteus** - `proteus doctor/tui/chat/tool test` pack-based iteration - open source
- **pw-control** - deterministic browser control

OPEN-SOURCE & ENGINEERING FUNDAMENTALS

- **Proteus, Ward, ViU, pw-control** - production LLM/agentic systems shipped, open source. There could be other stuff i missed other stuff i made public.
- **OpenClaw Code** - contribution only as above
- Strong fundamentals: evals, guardrails, monitoring, degraded-mode design, blast-radius isolation, measurement over assertion

AWARDS & EDUCATION

- 2026 Webby Award - People's Voice Winner, Best Responsible AI Implementation - **HITL**
- BSc Computing Science - AI & ML - Valley View University, Ghana - Jan 2025 - Aug 2028.
